

# What's New - May 2025

Last Modified on 05/08/2025 9:19 am MDT

This month you'll find many new enhancements to the Market section, as well as upgrades to livestock records and new planting reports. In the market, you'll now be able to set a default tax rate, sell products in new weight increments, and let your customers pay later by invoice. Working with animal records, you'll see a new alert field for displaying critical information, a streamlined process for performing bulk actions to a group in a grazing location, and some new reports for livestock values. And speaking of new reports, there are also two new ones for plantings as well, helping you see free space in your fields and seedling trays in your greenhouse.

## Market Updates

We have made many updates to the Market section this month! This includes new payment methods, new reports, and new ways to sell your products.

- **The menu and page layout for the Market section has been updated.** You'll see a new section for Settings, which includes all of the settings for your online store, pick up locations, orders, and images.
- **You can now set a default tax rate to be used for your orders.** This applies to all in-person orders, administratively created orders, and online shop orders (unless paid by credit card through Stripe, with auto-calculated taxes enabled.) This rate can be overridden on individual products as well.
- **Products can now be configured to allow for partial amounts to be purchased in the online store.** Previously your customers were limited to purchasing whole pounds/kilos, and you can now set an option to allow them to request partial amounts. This can be done at quarter, half, and tenth percentages, dependent on your choice per product.
- **A new invoice payment method is available.** This can be enabled in the settings, and lets your customers choose to pay later when you send them an invoice. This could be a great way to have a customer reserve something without paying, or order something that you need to update prior to shipping.
- **There are three new reports that help you prepare for pickup and deliveries.** These can help you be sure you bring the right items to the right pickup location and are prepared to meet your customers there.

## Livestock Updates

Have you tried out last month's new feature to [track estimated values for your animals over time](#)? If so, you'll now find two new reports to help you analyze your data!

- The **Animal Value History** report shows you starting and ending values for all of your animals, based on a date range you supply. This report is individual animal based, with this data shown for each one of your animals.
- The **Livestock Value Summary** report show similar starting and ending values, but summarized on a species level. You'll see any additions to your herd, like births, purchases, and donated animals. You'll also see deductions like deaths and sales. All of the values across the date range on compiled, so you can see where you started, and where you ended up!

You'll also find two new new time saving features for animal data,

- **Each animal now has a Record Alert**, letting you add critical information to be displayed in a can't-miss yellow highlight at the top of the record. This is shown on the mobile view too, so your farmhands working in the app will see it right away when they access the animal record.
- **You can now make Bulk Action Updates from a grazing location.** This works the same as you might be used to from the main dashboard or a group, but can now be accomplished for all animals in a grazing location. That makes it easier to apply treatments, feedings, notes, tasks, and more to any animals in a shared field or enclosure.

## Planting Reports

**We've added two additional planting reports** to help our northern hemisphere customers get started with their new planting season.

- The **Empty Planting Locations** report displays any field or bed that does not have a planting in it within a defined date range. Use this to make sure you maximize your growing space and fill your entire area.
- The **Expected Start Tray Counts** report shows you the total number of trays, and starts per tray, for any of your upcoming plantings. This can help you ensure you have enough seedlings started to cover your planting area, and adjust if you have unexpected loss rates.

Check out these new features and [let us know if you have any questions!](#)
